

PI ELISA TEST AGREEMENT

This agreement is between CATTLE STATS, LLC (CS, LLC), a privately held organization, and _____, owner/agent of the cattle to be tested of persistent BVD infection.

The test to be used to determine PI infected cattle will be the ELISA Antigen Capture Test, or ACE test. The ACE test was developed by Syracuse Bioanalytical, Inc. In their testing for licensing with the USDA they showed that the ear notch method has 100% sensitivity and 100% specificity. Central States Testing, LLC of Sublette, KS (a partner affiliate of CS, LLC) has extensively tested the ACE test against the "Gold Standard" IHC test and has found the ACE to be 100% specific and 100% sensitive with an extremely small chance of false positives. This data is on file at Central States Testing, LLC. In the feedyard and/or grower/stocker setting, CS, LLC does not feel that the false positive rate is a financial issue but with valuable breeding stock CS, LLC does recommend verification by retesting for conclusive results.

Therefore, by signing below, the client understands the ACE test will find a low percentage of false positive animals and it is the client's decision on retesting for verification.
